MAINTAINING DOCUMENT STATE HISTORY

CROSS REFERENCE TO RELATED APPLICATIONS

5 Not applicable.

STATEMENT REGARDING FEDERALLY SPONSORED  
RESEARCH OR DEVELOPMENT

Not Applicable.

BACKGROUND OF THE INVENTION

10 The present invention relates to electronic systems operable under program control to create and edit electronic documents.

A conventional feature of computer program applications that create and edit documents is an undo  
15 command. Applications written for the Microsoft® Windows 95 operating system often use Ctrl-Z as a keyboard shortcut for the undo command.

One mechanism for implementing undo in applications is based on a command object that knows how to do, undo, and  
20 redo an operation. This is described, for example, in Gamma et al., Design Patterns, Addison-Wesley Publishing Co., © 1995, pages 233 to 242. Multiple undo may then be implemented by keeping a command history. Gamma notes on page 239 that such an implementation has a strong potential  
25 for error accumulation and recommends using the "memento" pattern as part of the command object. Some applications provide a user with a list of the most recent actions and allow the user to select one of the actions, thereby undoing

the selected action and all actions above it (that is, all more recent actions) in the list.

A related feature available in some applications allows a user to save a document that is being edited and  
5 later revert to the saved version, thereby discarding intervening changes to the document.

The conventional behavior of an undo command restores the document to the state it had before the operation being undone was done.

## 10 SUMMARY OF THE INVENTION

In general, in one aspect, the invention provides methods and apparatus embodying techniques for performing operations on documents having states. The techniques include performing operations to maintain in a memory a  
15 state history of a document for storing document states; and, whenever an interesting operation has occurred, automatically capture the state of the document as it exists after the operation and adding the captured state to the state history.

20 In general, in another aspect, the techniques include operations to maintain a first history of interesting operations and a second history of all operations requested by a user, the second history but not the first history including operations global to the state  
25 of the application.

In general, in another aspect, the techniques include operations to receive from the user a sequence of commands to change the document; change the document state in response to each command; add the changed document state

to a state history maintained in a computer-readable memory device each time the document state is changed; for each document state added to the state history, add a corresponding entry to a history list displayed to the user on a computer-controlled display device operated as part of a graphical user interface; and, in response to a user action stepping backward to an item in the history list, update the document to have the corresponding document state saved in the state history.

10 In general, in another aspect, the techniques include operations to keep a history list; go back to a previous state in the history list; select a future state from the history list, being a state created after the previous state, as a source of data for an operation; and  
15 perform the operation with the future data on the previous state.

In general, in another aspect, the techniques include operations to keep a history of document states created by a user; enable the user to discard any of the history; and enable the user to step backward and forward  
20 through the history and thereby to alter the state of the document to be any of the document states in the history.

In general, in another aspect, the techniques include operations to keep a history of document states created automatically whenever a user command to the application changes the state of a document; enable the user  
25 to discard any user-selected set of the document states in the history; and enable the user to designate any one of the document states in the history and thereby install the designated state as the current state of the document.  
30

In general, in another aspect, the techniques include operations to create and modify a document; identify for a user on a display device a set of states that the document has been in by operation of the application; and  
5 enable the user to designate any arbitrary one of the identified states.

Particular implementations of the invention will have one or more of the following advantages. Use of a state history supports a quick and efficient multiple undo  
10 operation, particularly in the context of an application like a image editing application whose operations often act on an entire document. It enables a user to access prior states of a document randomly. It enables a prior state of a document to be turned into its own document. It provides  
15 a way to implement multiple undo efficiently while avoiding operation sequence dependencies. A large history of commands on a document may be navigated quickly and without increasing time cost for navigating over many commands. It somewhat simplifies treating multiple contiguous user  
20 commands -- such as multiple commands moving the same object in an image -- as a single command for undo purposes. Where revisions to one document may be made using data from another document, the invention provides a multiple undo feature without risk of inter-document dependencies.

25 Further advantages include the following. In a non-linear mode of operation, a user may edit a document starting from an earlier-captured document state without losing later-captured states. For example, using a digital painting application, a user may apply a series of filters  
30 to an image, then go back to the original image state, and

then selectively paint in the effects of those filters using  
a history paintbrush tool. Use of a smooth-moving control  
interface element allows a user easily to scan through a  
document's history while viewing the history states as they  
5 are selected by the control, creating a movie-like  
presentation of at least a portion of the document creation  
and editing process.

Other features and advantages of the invention will  
become apparent from the following description and from the  
10 claims.

#### BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a schematic block diagram of a computer  
system running an application program in accordance with the  
invention.

15 FIG. 2 shows a history palette user interface  
element of an implementation of the invention.

FIG. 3 is a flowchart of steps performed by an  
application operating in accordance with the invention.

FIG. 4 is a flowchart elaborating on FIG. 3.

20 FIG. 5 is a flowchart elaborating on FIG. 4.

#### DETAILED DESCRIPTION

As shown in FIG. 1, a conventional programmable  
computer system 100 has at least a processor component 114  
capable of executing computer program instructions, a memory  
25 component 112 for storing programs and data, and a user  
interface device or devices 116 by which a person -- a  
user -- may interact with programs running on the system  
100. These and other components are connected to interact

with each other by one or more buses 118. The memory component will generally include a volatile random access memory (RAM), a non-volatile read-only memory (ROM), and one or more large disk drives. The system may run one or more programs. Application 120 is a computer program designed for a particular task, and, as is typical, it acts on a central depository called a document, whose content a user creates and edits. Some applications, as illustrated, may allow a user to have more than one document, such as documents 130 and 140, open at a time, and allow the user to select one or the other of them as the active document that is the focus or target of editing and other document-directed actions.

A document is typically displayed in a rectangular region of the display screen called a document window. A spreadsheet application displays a spreadsheet document designed to look and act like a 2-dimensional table. A word-processing application displays a document designed to look like a sheet of paper. An image processing application displays a document designed to look like a photograph or a drawing.

As is conventional, application 120 is illustrated as having program instructions 122 that may be executed to operated on data 124. Application 120 is programmed to implement a state history feature, and so associates with each open document 130 and 140 a corresponding state history 132 and 142 and a corresponding undo buffer 134 and 144, respectively. The application also has an undo buffer 126 for the application itself. In an alternative implementation, the application undo buffer is the only undo

buffer and the commands stored there include a reference to the relevant document, if any. If the application undo buffer contains a command to undo, then all of the document undo buffers should be empty, to maintain intuitive operation of the undo-redo feature.

As shown in FIG. 2, an application implementing a history list provides, as part of a graphical user interface, a floating history palette 200 that a user may show or hide with menu commands or other user interface commands. Pertinent aspects of the operation of the application will now be described in terms of the information made available on the history palette 200 and the operations a user may perform using the history palette.

When a document is opened or newly created, the application generates a snapshot of the document and updates the snapshot or upper region 204 of the palette with a thumbnail image representing the snapshot and the name of the snapshot, which the user may edit. The lower portion 206 of the palette is initialized with an item named "Open" or "New", for the initial document state, so that the user will be able to step backward from his or her first state-changing operation. (This may be viewed as characterizing opening and creating a document as "interesting" operations, as described below.) The history palette 200 is associated with a particular document. If the user has two documents 130 and 140 (FIG. 1) open, each will have a separate history palette, and the history palette shown when one of the documents is active will reflect the state history 132 or 142, respectively, of the corresponding document 130 or 140.

Viewing parameters, such as a viewing magnification, which affect how the application displays the document but do not affect the actual document data, may be considered interesting in a particular implementation. For example, a viewing parameter that applies to all views of a document may well be treated as interesting and considered part of the state of the document; whereas, if the document can be viewed in multiple open windows with a viewing parameter that can be set differently for each view, the parameter would more naturally not be considered interesting or part of the document state.

The state of the document is recorded in the state history after the user makes a change to the document that changes the state of the document. The application may -- implicitly or expressly -- categorize commands into those that change the document state (the "interesting" ones) and those that do not. As an example, some commands, such as successive, consecutive commands moving a single object, may be interesting only in the aggregate, when they have been collapsed into a single move-object command. As another example, some commands are global, such as a change to a palette or to preferences, in that they change the state of the application, and are not made to a particular document.

When a document state is recorded, it is appended as an item at the end of the history list portion 206. Each item has an icon and a brief textual description of corresponding command. The icon shows the tool used to perform the command or, for menu and dialog commands, it is a menu or dialog icon. Both the upper portion 204 and the lower portion 206 are specific to the current document and

will change when a different document is made active.

The user may grab a small control 208 on the left side of the palette and drag it up and down to cause states of the document to be displayed, according to the position of the control. Doing so causes the current state -- the one being displayed as a result of the dragging action -- to be highlighted and those after it to be dimmed. In FIG. 2, the state corresponding to the second history list item, "Selection", is highlighted, and those following it are dimmed. Other user interface gestures, such as clicking on an item, will have the same effect. If the user then begins to alter the document, all items in the history list 206 below the selected item will be deleted. (An alternative and more powerful mode of operation -- non-linear history mode -- will be described later.)

The leftmost column of the floating palette has buttons 210 that may be selected to establish the corresponding state -- whether a state in the state history or a snapshot -- as the state that will be used as a source state by history-based tools. Such a selection is recorded on the palette with an icon to mark the selected state. As illustrated, a history paintbrush icon is used to indicate that the corresponding state will be used when a history paintbrush tool is used on the active document. If no more than one state may be selected as a source for history-based tools, the buttons 210 will behave like radio buttons, in that selecting one state will deselect any other selected state. As will be described, both earlier and later document states (that is, both items above and below the current state item in the history list) may be selected as a

history source.

The history paintbrush tool may be selected from a tool palette like any of the other tools that the user may select to perform operations on a document. In operation, the history paintbrush operates to paint on a target document input from the source. In an image application, the input may be pixel data, blending modes, clipping paths, or any other data that is part of the source document state. The semantics of the tool may -- but need not -- require the source to be a state (present, past, or future) of the target document; alternatively, the semantics may permit a tool to use as a source a state derived from a document entirely independent from the target document.

The history palette 200 may also be used as a source for a drag and drop command. When the user grabs an item on the palette and drags it to another document, the source state (the document state corresponding to the drag item) will be applied to the targeted document. The semantics of applying a state to a document are application specific, and may depend on the nature of the source state. (For example, it may be a complete document state, such as is found in the state history, or it may be a partial state, such as is captured when a snapshot is taken of a single layer of an image document.) In the semantics of one implementation, to apply a complete document state appends the source state to the history list and installs it as the current state of the target document. If the source is a partial state such as an image layer, it could be added as a layer to the target document. Alternatively, even a complete source image document could be flattened to a single layer and added to

the target document.

The history palette also has a pop-up menu 202. This menu provides commands to step forward through a history list, to step backward through a history list, to  
5 create a new snapshot, to delete a history or snapshot item, to clear the history list 206 (and corresponding state history), to create a new document from a saved document state, and to set options for the history features.

The step forward and step backward commands enable  
10 the user to walk backward and forward through the current history list 206, as was described earlier in reference to control 208.

A user may create a snapshot of any point in the document's history either by using the new-snapshot command  
15 in the pop-up menu 202 or by using the command button 214 in the palette. For example, a user may select a history state by moving control 208 to the corresponding list item and then selecting snapshot button 214, which will bring up a dialog window for the user to name the snapshot and  
20 optionally set snapshot control options. In particular, the user may choose to snapshot a full document from the state, a composition of all the layers of the document state, or the current layer as it exists in the selected document state. An item for the newly created snapshot will be  
25 appended to the upper list 204 of the palette.

As has been mentioned, the features associated with the history palette 200 operate differently in non-linear history mode from what has been described above in two important respects. In non-linear history mode, deleting an  
30 item from the history list 206 does not cause the items

below the deleted item to be deleted. Because the later document states are complete in themselves, earlier ones may be deleted with no adverse effect. Also, in non-linear history mode, a user may step backward to an earlier document state, begin working from there, and not cause the later document states to be deleted. Rather, the new document states are added to the end of the history list, which as a result will show two branches of state history.

Operation of the history palette records some, but not all, changes made by a user. Changes that are local to the document will be recorded, while changes that are global to the application will not be recorded. A global change, like changing a setting for a tool, will not cause a document state to be saved in a state history or an item to be added to the history list, because the document state has not been changed and therefore any previously captured state is still the state of the document. On the other hand, a local change, like creating or modifying a document path, layer, or channel, will cause a document state to be saved and an item to be added to the history list.

In conjunction with the history palette, it remains useful to have a conventional undo-redo feature that allows a user to undo and redo the most recent command without regard to whether it was local or global. This is accomplished by saving an undo item for the most recent user command in a document-specific buffer and applying the undo menu command or its keyboard shortcut as a toggle to undo and redo the operation.

FIG. 3 and FIG. 4, along with the accompanying description, are intended to explain the operation and use

of the state history feature so that they may be readily understood, and so details of implementation and optimization are omitted. A practical implementation of the pertinent command dispatch and processing functions would be expected to combine and reorganize the illustrated steps and implement them in accordance with well-understood software engineering techniques.

As shown in FIG. 3, the operation of an implementation of the state history feature may be seen to begin when a user enters a command (step 302). A command is a request made by the user to the application, through a graphical user interface, for example, to change the state of the application or the state of the active document. The application performs the corresponding action (step 304, which will be elaborated in reference to FIG. 4). If the action is one categorized as not affecting the state of a document (the no branch of decision step 306), the state history and history list are unaffected. Otherwise, if the action of the command was performed with the document in the state of the temporally most recent entry in the history list, which corresponds to the temporally most recent state in the state history, the state of the document after the action is stored in the state history and the history list on the history palette is updated (the yes branch of step 308, and steps 312, 314, and 320). On the no branch of step 308, if non-linear history mode is in effect, nothing is discarded from the history list or the state history merely because an interesting command has been entered (the yes branch of step 310). In linear history mode (the no branch of step 310), the history list items below the current state

item and the corresponding states in the state history are discarded, other than any item selected as a source for history-based tools, such as the history paintbrush (see description of buttons 210, above).

5           If the maximum size of the history list or state history had been reached, the top (earliest) item from the history list -- excluding any item selected as a source for history-based tools -- is discarded, along with its corresponding document state in the state history, before  
10 the new document state is stored (the no branch of step 312 and step 318).

          To produce a practical implementation, it is advantageous to store document states in a form that allows a great deal of sharing between saved states, to keep to a  
15 minimum the amount of memory consumed in storing redundant information, and the processor resources consumed in writing and reading it. A data representation suitable for this purpose is described in commonly-owned U.S. patent application serial no. 08/702,941 to Hamburg for "Shared  
20 Tile Image Representations" filed August 26, 1996, the disclosure of which is incorporated here by this reference.

          Referring to FIG. 4, aspects of the perform action step (step 30, FIG. 3) pertinent to an implementation of a state history feature will not be described. If the user's  
25 command is not an undo or a redo, that is, not the Ctrl-Z toggle, the command is stored in an undo buffer associated with the active document, such as buffers 134 and 144 of FIG. 1 (the yes branch of decision step 410 and step 412). If the command is an undo or a redo, the undo or redo  
30 operation of the command in the undo buffer is executed

(step 412). It should be noted that the history-related commands, and in particular changes to the history list and the state history, can be subject to the conventional undo and redo (step 412). The provides an advantageous and  
5 elegant user interface that allows, for example, a user to toggle between two document states previously selected from anywhere in the state history with a single repeated keystroke.

Returning to FIG. 4, the next pertinent step  
10 considers whether the command relates to the history list or the history palette. If not, the command is performed (step 418) and operation continues (step 420) with decision step 306 (FIG. 3). Otherwise, the command is one that uses the history list (the yes branch of decision step 416), and the  
15 processing of it will now be described.

If the command navigates the history list -- for example, a step backward command, step forward command, or list item selection command -- the document state corresponding to selected item is installed as the current  
20 state of the active document (steps 430 and 432).

If the command designates a source for history-based commands -- for example, a command selecting a column 210 button to designate a source for the history paintbrush -- the targeted history state is linked as the source document  
25 to the tools that can take a source document state as an input (steps 434 and 436). The history-based commands that may be implemented in a painting application include the history paintbrush, which paints from the source state onto the active document; a fill-from-history command that  
30 performs a fill operation on the active document with input

from the source state; and an eraser that erases the active document to the source state. As has been mentioned, the source state may be either earlier or later than the current state, enabling a user to paint from either the future or  
5 the past.

If the command deletes a history list item (the yes branch of step 438), the behavior depends on whether the operating mode is linear history mode or non-linear history mode and where in the history list the selected item falls  
10 (step 444). As shown in FIG. 5, in non-linear history mode, only the selected item and its document state are deleted (the yes branch of decision step 502 and step 504).

Otherwise, the position of the selected item with respect to the current state of the document is considered (step 506).

15 If the selected item is below (was created later than) the current state or the same as the current state, both the selected item and its state, and any later items (below the selected item in the history list) and their states are also deleted (step 510). If the selected item is above (was  
20 created earlier than) the current state, both the selected item and its state, and any earlier items (above the selected item in the history list) and their states are also deleted (step 508). Where a range of states is deleted (steps 508 and 510), a special check is made not to delete  
25 any item selected as a source for history-based tools.

Returning to FIG. 4, if the command creates a new document (the yes branch of decision step 446), the initial state of the new document is copied from the document state in the state history corresponding to the selected history  
30 list item (step 448).

A clear history command may also be implemented, with which a user may delete all non-snapshot states other than the current state and any history paintbrush source state.

5 A state history feature is particularly advantageous in an image manipulation application, such as the Photoshop® program available from Adobe Systems Incorporated of San Jose, California. In this application, each document is, as is typical, a single-page image that is generally viewed as  
10 a whole by the user in the process of creation and editing. This application has many powerful painting and selection tools, supports multiple layers, each with multiple channels, special effects filters, and lighting effects. In this sophisticated environment, the state history feature  
15 with its non-linear operating mode is particularly advantageous, in that it permits a user to step backward and forward through a set of states, picking up effects from a future state and applying them to a past state to create a new branch of development of an image.

20 The invention may be implemented in digital electronic circuitry, or in computer hardware, firmware, software, or in combinations of them. Apparatus of the invention may be implemented in a computer program product tangibly embodied in a machine-readable storage device for  
25 execution by a programmable processor; and method steps of the invention may be performed by a programmable processor executing a program of instructions to perform functions of the invention by operating on input data and generating output. The invention may advantageously be implemented in  
30 one or more computer programs that are executable on a

programmable system including at least one programmable processor coupled to receive data and instructions from, and to transmit data and instructions to, a data storage system, at least one input device, and at least one output device.

5 Each computer program may be implemented in a high-level procedural or object-oriented programming language, or in assembly or machine language if desired; and in any case, the language may be a compiled or interpreted language. Suitable processors include, by way of example, both general  
10 and special purpose microprocessors. Generally, a processor will receive instructions and data from a read-only memory and/or a random access memory. Storage devices suitable for tangibly embodying computer program instructions and data include all forms of non-volatile memory, including by way  
15 of example semiconductor memory devices, such as EPROM, EEPROM, and flash memory devices; magnetic disks such as internal hard disks and removable disks; magneto-optical disks; and CD-ROM disks. Any of the foregoing may be supplemented by, or incorporated in, specially-designed  
20 ASICs (application-specific integrated circuits).

Other embodiments are within the scope of the following claims. For example, the order of performing steps of the invention may be changed by those skilled in the art and still achieve desirable results. Forms of user  
25 interface other than a list on a palette to show state history may be used, such as a stack of items or a pull-down or pop-up menu, and that revision branches created in non-linear history mode may be shown as a tree or other representation of an directed acyclic graph. To satisfy  
30 user preferences for how an undo-redo feature or a state

history feature should behave in a particular application,  
the application may be implemented to treat selected  
commands or operations as not interesting and therefore not  
captured in an undo buffer or a state history, to conform  
5 the design of the user interface of the application to user  
expectations. The user interface aspects of the invention  
may be embodied using methods of preserving document state  
information other than storing an entire state, for example,  
by storing state differences or even command histories.

10 What is claimed is:

## CLAIMS

1 1. A method implemented in a computer program application  
2 performing operations on documents having states, the method  
3 comprising:

4 maintaining in a memory a state history of a document  
5 for storing document states; and

6 whenever an interesting operation has occurred,  
7 automatically capturing the state of the document as it  
8 exists after the operation and adding the captured state to  
9 the state history.

10 2. The method of claim 1, wherein the memory comprises a  
11 disk file.

12 3. The method of claim 1, wherein:

13 the state history includes states of the document and  
14 the order in which the stored states were automatically  
15 added to the state history;

the state history is displayed to a user as a list of  
document states shown in their stored order;

an operation is classified as an interesting operation  
if it changes the state of the document;

a state is added to the state history only if the  
operation creating the state is classified as an interesting  
operation and not otherwise;

performing a step backward operation by installing as  
the current state of the document a state stored in the  
state history, whereby all step backward operations place  
the document in a state that occurred immediately after an

16 interesting operation;

17 performing a step forward operation by installing as  
18 the current state of the document a state stored in the  
19 state history, whereby all step forward operations place the  
20 document in a state that occurred immediately after an  
21 interesting operation;

22 4. The method of claim 3, wherein:

23 the list of document states displayed to the user  
24 comprises a list of items, each item representing a state of  
25 the document that existed after an interesting operation and  
26 that can be recovered with a step backward operation in the  
27 application; and

28 the list of document states displayed to the user  
29 comprises a list of items, each item representing a state of  
30 the document that existed after an interesting operation and  
31 that can be recovered directly by selecting the item.

32 5. The method of claim 4, wherein:

33 the application is digital graphics program operable to  
34 create and revise images in digital form;

35 the application provides a tool operable under user  
36 control to obtain source material from any state in the  
37 state history and apply it to a current state of the  
38 document; and

39 the images are raster images.

1 6. The method of claim 4, wherein:

2 the application enables a user to select any item in  
3 the displayed list of items and cause the application to  
4 create a new document having the document state  
5 corresponding to the selected item.

1 7. The method of claim 4, wherein:

2 each of the captured states in the state history  
3 maintains the state data in essentially its original form,  
4 whereby the captured state data is suitable for immediate  
5 use in other operations.

1 8. A method for enabling a user to undo revisions made to a  
2 document, the method comprising:

3 maintaining a first history of interesting operations  
4 and a second history of all operations requested by a user,  
5 the second history but not the first history including  
6 operations global to the state of the application.

1 9. A computer-implemented method of interacting with a user  
2 editing a document in a computer program application, the  
3 document having a document state, the method comprising:

4 receiving from the user a sequence of commands to  
5 change the document;

6 changing the document state in response to each  
7 command;

8 adding the changed document state to a state history  
9 maintained in a computer-readable memory device each time  
10 the document state is changed;

11 for each document state added to the state history,

12 adding a corresponding entry to a history list displayed to  
13 the user on a computer-controlled display device operated as  
14 part of a graphical user interface; and

15 in response to a user action stepping backward to an  
16 item in the history list, updating the document to have the  
17 corresponding document state saved in the state history.

1 10. The method of claim 9, wherein:

2 the state history and the history list are limited to  
3 storing a preset number of items and excess items are  
4 scrolled off the top of the list as new items are added.

1 11. The method of claim 9, wherein:

2 the state history is stored in a region of memory and  
3 the oldest document states in the state history are  
4 discarded when free space in the region runs low.

1 12. The method of claim 11, wherein:

2 the oldest document states are found and discarded by a  
3 memory management process.

1 13. The method of claim 9, wherein:

2 a command to change the document that comes after a  
3 step backward command to a selected item in the history list  
4 causes the items after the selected item to be deleted from  
5 the history list and the corresponding document states to be  
6 deleted from the state history.

1 14. The method of claim 9, wherein:

2 a command to change the document that comes after a  
3 step backward command to a selected item in the history list  
4 does not cause the items after the selected item to be  
5 deleted from the history list and adds a new item to the end  
6 of the history list and a new document state to the state  
7 history.

1 15. The method of claim 9, further comprising:

2 enabling a user interface gesture on the history list  
3 to create a new document from a document state from the  
4 state history.

1 16. A method implemented in a computer program application  
2 operable to create and edit a document, comprising:

3 keeping a history list;

4 going back to a previous state in the history list;

5 selecting a future state from the history list, being a  
6 state created after the previous state, as a source of data  
7 for an operation; and

8 performing the operation with the future data on the  
9 previous state.

1 17. A method implemented in a computer program application  
2 operable to create and edit a document, comprising:

3 keeping a history of document states created by a user;

4 enabling the user to discard any of the history; and

5 enabling the user to step backward and forward through  
6 the history and thereby to alter the state of the document  
7 to be any of the document states in the history.

8 18. A method implemented in a document-processing computer  
9 program application, the method comprising:

10 keeping a history of document states created  
11 automatically whenever a user command to the application  
12 changes the state of a document;

13 enabling the user to discard any user-selected set of  
14 the document states in the history; and

15 enabling the user to designate any one of the document  
16 states in the history and thereby install the designated  
17 state as the current state of the document.

1 19. The method of claim 18, further comprising:

2 saving the history when the document is closed on a  
3 long-term storage medium, whereby the history may be  
4 restored when the document is later opened and across  
5 invocations of the application.

1 20. The method of claim 19, wherein:

2 the saved history resides in the document with final  
3 document data.

1 21. The method of claim 19, wherein:

2 the saved history resides in a long-term data  
3 repository independent of the original document.

1 22. A method enabling a user to control operation of a  
2 computer program application for creating and modifying a  
3 document, the method comprising:  
4 identifying for the user on a display device a set of  
5 states that the document has been in by operation of the  
6 application; and  
7 enabling the user to designate any arbitrary one of the  
8 identified states.

1 23. The method of claim 22, further comprising:  
2 displaying the document in a user interface window, the  
3 document being a digital image.

1 24. The method of claim 23, wherein the digital image has a  
2 plurality of layers, each of the plurality of layers having  
3 a plurality of channels, the method further comprising:  
4 displaying user-interface elements for applying filters  
5 to the digital image.

1 25. The method of claim 22, further comprising:  
2 installing the designated state as the current state of  
3 the document in response to a user command.

1 26. The method of claim 22, further comprising:  
2 providing the user an editing tool having the  
3 designated state as a document state operand.

1 27. The method of claim 22, further comprising:  
2 providing the user an delete tool for deleting the  
3 designated state from the set of states.

4 28. The method of claim 22, wherein:

5 the set of states is identified by displaying a  
6 scrollable list of elements each identifying one of the  
7 states in the set.

1 29. The method of claim 27, wherein the list elements are  
2 ordered by the time the corresponding states were created.

1 30. The method of claim 24, wherein the designation and  
2 installation are performed in response to a single command.

1 31. The method of claim 24, wherein the set of states is  
2 displayed in an order, the method further comprising:  
3 enabling the user to make a gesture on a user interface  
4 indicating a sequence of displayed state identifiers and  
5 responding to the gesture by displaying the document in the  
6 states indicated as the gesture is made.

1 32. The method of claim 24, further comprising:  
2 enabling the user to modify the document state after  
3 the installing step; and  
4 adding the document state resulting from the  
5 modification to the set of states identified on the display  
6 device.

1 33. The method of claim 30, wherein the set of states is  
2 displayed in order of creation of the states in the set.

1 34. The method of claim 30, wherein the document is a  
2 digital image.

3 35. The method of claim 24, further comprising:  
4 providing a step backward and a step forward command  
5 for the user to execute to navigate the set of states; and  
6 providing a separate undo and redo command for the user  
7 to undo and redo commands entered by the user.

1 36. The method of claim 25, further comprising:  
2 providing a step backward and a step forward command  
3 for the user to execute to navigate the set of states; and  
4 providing a separate undo and redo command for the user  
5 to undo and redo commands entered by the user.

1 37. Apparatus comprising a computer-readable storage medium  
2 tangibly embodying program instructions defining a computer  
3 program application for performing operations on documents  
4 having states, the program comprising instructions operable  
5 for causing a programmable processor to:

6 maintain in a memory a state history of a document for  
7 storing document states; and

8 whenever an interesting operation has occurred,  
9 automatically capture the state of the document as it exists  
10 after the operation and adding the captured state to the  
11 state history.

1 38. Apparatus comprising a computer-readable storage medium  
2 tangibly embodying program instructions for use by a user of  
3 a program to undo revisions made to a document, the  
4 apparatus comprising instructions operable for causing a  
5 programmable processor to:

6 maintain a first history of interesting operations and

7 a second history of all operations requested by a user, the  
8 second history but not the first history including  
9 operations global to the state of the application.

1 39. Apparatus comprising a computer-readable storage medium  
2 tangibly embodying program instructions for interacting with  
3 a user editing a document in a computer program application,  
4 the document having a document state, the apparatus  
5 comprising instructions operable for causing a programmable  
6 processor to:

7 receive from the user a sequence of commands to change  
8 the document;

9 change the document state in response to each command;

10 add the changed document state to a state history  
11 maintained in a computer-readable memory device each time  
12 the document state is changed;

13 for each document state added to the state history, add  
14 a corresponding entry to a history list displayed to the  
15 user on a computer-controlled display device operated as  
16 part of a graphical user interface; and

17 in response to a user action stepping backward to an  
18 item in the history list, update the document to have the  
19 corresponding document state saved in the state history.

1 40. A computer program, residing on a computer-readable  
2 medium, comprising instructions for causing a computer to:

3 keep a history list;

4 go back to a previous state in the history list;

5 select a future state from the history list, being a  
6 state created after the previous state, as a source of data

7       for an operation; and

8             perform the operation with the future data on the  
9       previous state.

1       41. A computer program, residing on a computer-readable  
2       medium, comprising instructions for causing a computer to:  
3             keep a history of document states created by a user;  
4             enable the user to discard any of the history; and  
5             enable the user to step backward and forward through  
6       the history and thereby to alter the state of the document  
7       to be any of the document states in the history.

1       42. A computer program, residing on a computer-readable  
2       medium, comprising instructions for causing a computer to:  
3             keep a history of document states created automatically  
4       whenever a user command to the application changes the state  
5       of a document;  
6             enable the user to discard any user-selected set of the  
7       document states in the history; and  
8             enable the user to designate any one of the document  
9       states in the history and thereby install the designated  
10       state as the current state of the document.

1 43. A computer program, residing on a computer-readable  
2 medium, comprising instructions for causing a computer to:  
3 create and modify a document;  
4 identify for a user on a display device a set of states  
5 that the document has been in by operation of the  
6 application; and  
7 enable the user to designate any arbitrary one of the  
8 identified states.

ABSTRACT OF THE DISCLOSURE

Methods and apparatus embodying techniques useful in systems for creating and modifying documents. A state history of a document for storing document states is maintained; and, whenever an interesting operation has occurred, the state of the document is automatically captured as it exists after the operation. The captured state is added to the state history. In another aspect, the techniques identify for a user on a display device a set of states that the document has been in by operation of the system; and enable the user to designate any arbitrary one of the identified states for further operations. The techniques may provide both linear and non-linear history.

COMBINED DECLARATION AND POWER OF ATTORNEY

As a below-named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled:

**MAINTAINING DOCUMENT STATE HISTORY**

the specification of which:

☒ is attached hereto.

☐ was filed on \_\_\_\_\_, and identified as Attorney Docket No. \_\_\_\_\_.

☐ was filed on \_\_\_\_\_, as Application Serial No. \_\_\_\_\_.

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to the examination of this application in accordance with Title 37, code of Federal Regulations, Section 1.56(a).

I hereby appoint the following attorneys and/or agents to prosecute this application and to transact all business in the Patent and Trademark Office connected therewith:

Roger S. Borovoy, Reg. No. 20,193; Hans R. Troesch, Reg. No. 36,950; John F. Land, Reg. No. 29,554; David J. Goren, Reg. No. 34,609; Mark D. Kirkland, Reg. No. 40,048; John D. Cowart, Reg. No. 38,415; John C. Phillips, Reg. No. 35,322; Dan C. Hu, Reg. No. 40,025; Coe F. Miles, Reg. No. 38,559; Denis G. Maloney, Reg. No. 29,670; David L. Feigenbaum, Reg. No. 30,378; Stephan J. Filipek, Reg. No. 33,384

Address all telephone calls to Hans R. Troesch at telephone number 650/322-5070.

Address all correspondence to Roger S. Borovoy, Fish & Richardson P.C., 2200 Sand Hill Road, Suite 100, Menlo Park, CA 94025.

☒ For Assigned Inventions: I understand that the purpose of making this appointment is to permit prosecution of patent applications for the above-identified invention for the benefit of my assignee, and that this appointment does not create an attorney-client relationship between me and these appointees.

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

Full name of inventor: Mark Hamburg
